

R⁶RS: Standard Language

Version 4.0

June 11, 2008

The The Revised⁶ Report on the Algorithmic Language Scheme defines a dialect of Scheme. We use *R⁶RS* to refer to both the standard and the language defined by the standard.

R⁶RS defines both *libraries* and *top-level programs*. Both correspond to PLT Scheme *modules* (see §6 “Modules”). That is, although R⁶RS defines top-level programs as entry points, you can just as easily treat a library as an entry point when using PLT Scheme. The only difference is that an R⁶RS top-level program cannot export any bindings to other modules.

--------------	--	-----------

1 Running Top-Level Programs

To run a top-level program, either:

- Use the `plt-r6rs` executable, supplying the file that contains the program on the command line:

```
plt-r6rs <program-file>
```

Additional command-line arguments are propagated as command-line arguments to the program (accessed via [command-line](#)).

To compile the file to bytecode (to speed future runs of the program), use `plt-r6rs` with the `--compile` flag:

```
plt-r6rs --compile <program-file>
```

The bytecode file is written in a "compiled" sub-directory next to *<program-file>*.

For example, if "hi.scm" contains

```
(import (rnrs))
(display "hello\n")
then
  plt-r6rs hi.scm
prints "hello."
```

- Prefix the program with `#!r6rs`, which counts as a comment from the R⁶RS perspective, but is a synonym for `#lang r6rs` from the PLT Scheme perspective. Such files can be run like any other PLT Scheme module, such as using `mzscheme`:

```
mzscheme <program-file>
```

or using DrScheme with the Module language. The file can also be compiled to bytecode using `mzc`:

```
mzc <program-file>
```

For example, if "hi.ss" contains

```
#!r6rs
(import (rnrs))
(display "hello\n")
then
  mzscheme hi.ss
```

prints "hello." Similarly, opening "hi.ss" in DrScheme and clicking Run prints "hello" within the DrScheme interactions window.

2 Installing Libraries

To reference an R⁶RS library from a top-level program or another library, it must be installed as a collection-based library in PLT Scheme.

One way to produce an R⁶RS installed library is to create in a collection a file that starts with `#!r6rs` and that contains a `library` form. For example, the following file might be created in a "hello.ss" file within a "examples" collection directory:

```
#!r6rs
(library (examples hello)
 (export greet)
 (import (rnrs)))

(define (greet)
 (display "hello\n"))
```

Alternately, the `plt-r6rs` executable with the `--install` flag accepts a sequence of `library` declarations and installs them into separate files in a collection directory, based on the declared name of each library:

```
plt-r6rs --install <libraries-file>
```

By default, libraries are installed into the user-specific collection directory (see `find-user-collects-dir`). The `--all-users` flag causes the libraries to be installed into the main installation, instead (see `find-collects-dir`):

```
plt-r6rs --install --all-users <libraries-file>
```

See §3 “Libraries and Collections” for information on how R⁶RS library names are turned into collection-based module paths, which determines where the files are written. Libraries installed by `plt-r6rs --install` are automatically compiled to bytecode form.

One final option is to supply a `++path` flag to `plt-r6rs`. A path added with `++path` extends the set of directories that are searched to find a collection (i.e., it sets `current-library-collection-paths`). If `<dir>` contains "duck" and "cow" sub-directories with "duck/feather.sls" and "cow/bell.sls", and if each file is an R⁶RS library prefixed with `#!r6rs`, then `plt-r6rs ++path <dir>` directs the R⁶RS library references `(duck feather)` and `(cow bell)` to the files. Note that this technique does not support accessing "duck.sls" directly within `<dir>`, since the library reference `(duck)` is treated like `(duck main)` for finding the library, as explained in §3 “Libraries and Collections”. Multiple paths can be provided with multiple uses of `++path`; the paths are search in order, and before the installation’s collections.

3 Libraries and Collections

An R⁶RS library name is sequence of symbols, optionally followed by a version as a sequence of exact, non-negative integers. Roughly, such a name is converted to a PLT Scheme module pathname (see §6.3 “Module Paths”) by concatenating the symbols with a `/` separator, and then appending the version integers each with a preceding `-`. As a special case, when an R⁶RS path contains a single symbol followed by a version, a `main` symbol is effectively inserted after the initial symbol.

When an R⁶RS library or top-level program refers to another library, it can supply version constraints rather than naming a specific version. Version constraints are always resolved at compile time by searching the set of installed files.

In addition, when an R⁶RS library path is converted, a file extension is selected at compile time based on installed files. The search order for file extensions is `.mzscheme.ss`, `.mzscheme.sls`, `.ss`, and `.sls`. When resolving version constraints, these extensions are all tried when looking for matches.

Examples (assuming a typical PLT Scheme installation):

```
(rnrs io simple (6)) means (lib "rnrs/io/simple-6.ss")
(rnrs)                means (lib "rnrs/main-6.ss")
(rnrs (6))            means (lib "rnrs/main-6.ss")
(scheme base)        means (lib "scheme/base.ss")
```

4 Scheme Interoperability

Using the conversion rules in §3 “Libraries and Collections”, and R⁶RS library can refer to modules that are implemented in other dialects supported by PLT Scheme, and other PLT Scheme modules can refer to libraries that are implemented in R⁶RS.

Beware that a *pair* in R⁶RS corresponds to a *mutable pair* in `scheme/base`. Otherwise, R⁶RS libraries and `scheme/base` share the same datatype for numbers, characters, strings, bytevectors (a.k.a. byte strings), vectors, and so on. Hash tables are different. Input and output ports from `scheme/base` can be used directly as binary ports with R⁶RS libraries, and all R⁶RS ports can be used as ports in `scheme/base` programs, but only textual ports created via R⁶RS libraries can be used by other R⁶RS operations that expect textual ports.

5 R⁶RS Conformance

PLT Scheme's R⁶RS support does not conform with the standard in several known ways:

- When guard catches an exception that no clause matches, the exception is re-**raised** without restoring the continuation to the one that raised the exception.

This difference can be made visible using `dynamic-wind`. According to R⁶RS, the following program should print “in” and “out” twice, but each prints once using PLT Scheme:

```
(guard (exn [(equal? exn 5) 'five]))
  (guard (exn [(equal? exn 6) 'six]))
    (dynamic-wind
      (lambda () (display "in") (newline))
      (lambda () (raise 5))
      (lambda () (display "out") (newline))))
```

Along similar lines, continuation capture and invocation within an exception handler is restricted. Unless the exception is raised through `raise-continuable`, a handler can escape only through a continuation that is a tail of the current continuation, and a continuation captured within the handler cannot be invoked after control escapes from the raise.

- Currently, inexact numbers are printed without a precision indicator, and precision indicators are ignored on input (e.g., `0.5|7` is read the same as `0.5`).
- Word boundaries for `string-downcase`, `string-upcase`, and `string-titlecase` are not determined as specified by Unicode Standard Annex #29.
- When an identifier bound by `letrec` or `letrec*` is referenced before it is bound, an exception is not raised; instead, the reference produces `#<undefined>`.
- The bindings in a namespace produced by `null-environment` or `scheme-report-environment` correspond to R⁵RS bindings instead of R⁶RS bindings. In particular, `=>`, `else`, `_`, and `...` are not bound.

6 R⁶RS Libraries

6.1 `(rnrs base (6))`: Base

`(require rnrs/base-6)`

Original specification: Base

6.2 `(rnrs unicode (6))`: Unicode

`(require rnrs/unicode-6)`

Original specification: Unicode

6.3 `(rnrs bytevectors (6))`: Bytevectors

`(require rnrs/bytevectors-6)`

Original specification: Bytevectors

6.4 `(rnrs lists (6))`: List utilities

`(require rnrs/lists-6)`

Original specification: List utilities

6.5 `(rnrs sorting (6))`: Sorting

`(require rnrs/sorting-6)`

Original specification: Sorting

6.6 `(rnrs control (6))`: Control Structures

`(require rnrs/control-6)`

Original specification: Control Structures

6.7 (nrns records syntactic (6)): Records: Syntactic

(require nrns/records/syntactic-6)

Original specification: Records: Syntactic

6.8 (nrns records procedural (6)): Records: Procedural

(require nrns/records/procedural-6)

Original specification: Records: Procedural

6.9 (nrns records inspection (6)): Records: Inspection

(require nrns/records/inspection-6)

Original specification: Records: Inspection

6.10 (nrns exceptions (6)): Exceptions and Conditions

(require nrns/exceptions-6)

Original specification: Exceptions and Conditions

See also §5 “R⁶RS Conformance”.

6.11 (nrns conditions (6)): Exceptions and Conditions

(require nrns/conditions-6)

Original specification: Exceptions and Conditions

6.12 (nrns io ports (6)): I/O: Ports

(require nrns/io/ports-6)

Original specification: I/O: Ports

6.13 `(rnrs io simple (6))`: I/O: Simple

`(require rnrs/io/simple-6)`

Original specification: I/O: Simple

6.14 `(rnrs files (6))`: File System

`(require rnrs/files-6)`

Original specification: File System

6.15 `(rnrs programs (6))`: Command-line Access and Exit Values

`(require rnrs/programs-6)`

Original specification: Command-line Access and Exit Values

6.16 `(rnrs arithmetic fixnums (6))`: Arithmetic: Fixnums

`(require rnrs/arithmetic/fixnums-6)`

Original specification: Arithmetic: Fixnums

6.17 `(rnrs arithmetic flonums (6))`: Arithmetic: Flonums

`(require rnrs/arithmetic/flonums-6)`

Original specification: Arithmetic: Flonums

6.18 `(rnrs arithmetic bitwise (6))`: Arithmetic: Bitwise

`(require rnrs/arithmetic/bitwise-6)`

Original specification: Arithmetic: Bitwise

6.19 `(rnrs syntax-case (6))`: Syntax-Case

```
(require rnrs/syntax-case-6)
```

Original specification: Syntax-Case

6.20 `(rnrs hashtables (6))`: Hashtables

```
(require rnrs/hashtables-6)
```

Original specification: Hashtables

A hashtable is a dictionary in the sense of `scheme/dict`.

6.21 `(rnrs enums (6))`: Enumerations

```
(require rnrs/enums-6)
```

Original specification: Enumerations

6.22 `(rnrs eval (6))`: Eval

```
(require rnrs/eval-6)
```

Original specification: Eval

6.23 `(rnrs mutable-pairs (6))`: Mutable Pairs

```
(require rnrs/mutable-pairs-6)
```

Original specification: Mutable Pairs

6.24 `(rnrs mutable-strings (6))`: Mutable Strings

```
(require rnrs/mutable-strings-6)
```

Original specification: Mutable Strings

6.25 `(nrns r5rs (6))`: R5RS Compatibility

`(require nrns/r5rs-6)`

Original specification: R5RS Compatibility

See also §5 “R⁶RS Conformance”.
